Custom Wordlist Generator

1. Introduction

This project implements a Custom Wordlist Generator used in ethical hacking. The tool generates password lists based on personal user data such as name, date of birth, pet name, and favorite word.

---

2. Tool Description

The tool takes user inputs and generates multiple password combinations using:

- Numbers
- Symbols
- Word permutations

The generated wordlist is saved into a file and can be used for password testing.

---

3. Test Results

Test Case	Input	Output Count
1	raghav, 28012006, jim, gun	48
2	arun, 2001, leo, star	51
3	a , 1999, x, z	31

☞ To find count:

```
wc -l wordlist_filename.txt
```

---

4. Analysis

The tool successfully generates multiple password combinations.
Different inputs produce different outputs.
Edge cases are handled properly.
Longer passwords improve security strength.

---

5. Error Encountered

Example error:

```
ModuleNotFoundError: No module named 'tool_main'
```

Solution:
The issue was fixed by ensuring all Python files are in the same directory and correctly imported.

---

6. Ethical Considerations

This tool is intended only for ethical hacking and penetration testing with proper authorization. Unauthorized use is illegal.
